

Water Replenishment - Bringing a forest back to life

(Spain)

In 2018, we completed a project to protect groundwater close to our Aquabona manufacturing site in Northern Spain, which was severely impacted following a forest fire in 2009. The project involved restoring native and fire resilient trees, protecting grassland habitats and controlling vegetation growth. It was carried out together with The Coca-Cola Company and in partnership with the Ecology and Development Foundation (ECODES) and local government. We replenished 943.8 million litres of water, planted over 66,300 trees and restored 57 hectares of land in 2018.

As a result of this project, rainwater recovery has improved by 20% and the local biodiversity and ecosystem will be protected for at least 20 years.
